Supply Chain Sales, Profit, Discount & Delivery Analysis

Summary

Performance was broadly stable across the three complete years, with annual sales of $12.30 million in 2016, and $11.81 million in 2017. The large decline in 2018 is a coverage effect because only January is present.

Key Performance Indicators

Indicator	Result	Interpretation
Recorded sales	$36.8M	All available periods
Recorded profit	$4.0M	Order Profit Per Order measure
Estimated profit to sales	10.8%	Descriptive ratio
Largest sales market	Europe	Approximately $10.87M
Second Largest market	LATAM	Approximately $10.28M
Low profit rows	52,937	Rows below a 10% profit ratio threshold

Sales Performance

Sales were stable in 2015 and 2016 and eased by about 4.0% in 2017. January 2018 contributes $0.33 million, but it must not be compared with full-year totals.

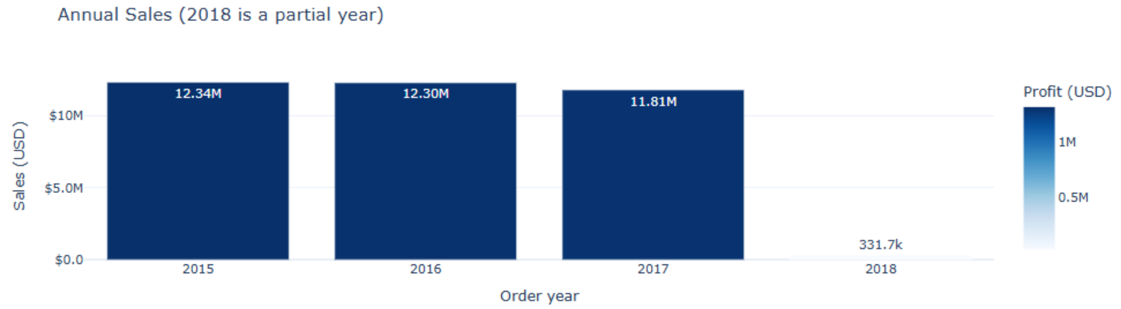

Figure 1 Annual sales with 2018 shown as a partial year

Monthly Pattern

Monthly sales generally remained near $1.0 million through most of 2015 to October 2017. The sharp decline in the final observations coincides with incomplete period coverage rather than evidence of a confirmed structure collapse. Before making a trend claim, the source should be checked for completed November and December 2017 records and the January 2018 cutoff.

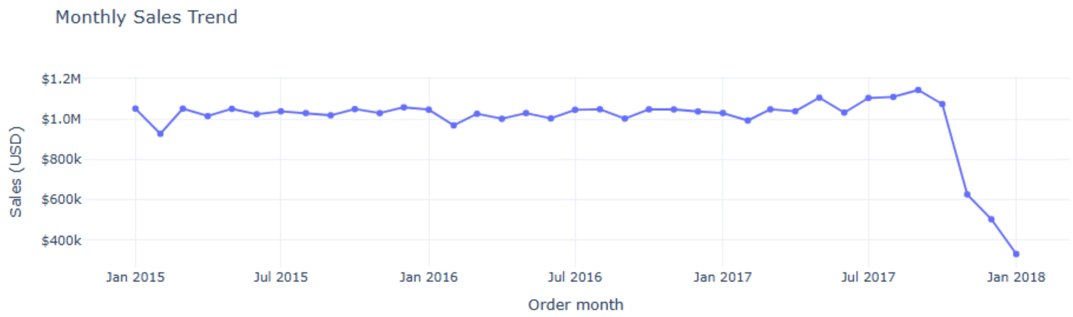

Figure 2 Monthly sales trend across the available order dates

Market Contribution

Europe and LATAM are the commercial core of the portfolio. Together they generated about $21.15 million in sales, or roughly 57.5% of recorded sales. Europe also produced the largest total profit, followed closely by LATAM.

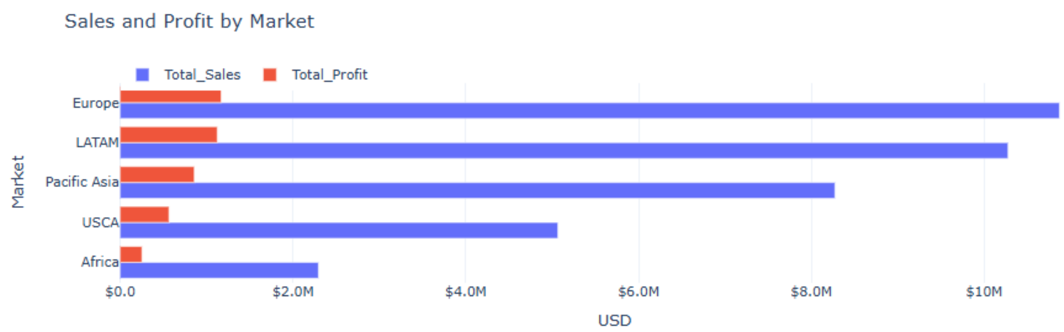

Figure 3 Sales and profit contribution by market

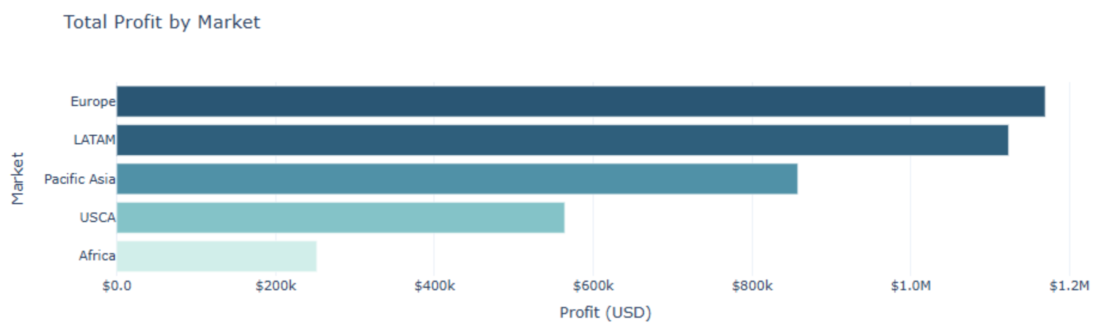

Figure 4 Total profit ranking by market

Market Findings

Market	Sales	Profit	Average Profit Ratio
Europe	$10.87M	$1.17M	12.24%
LATAM	$10.28M	$1.12M	12.12%
Pacific Asia	$8.27M	$0.86M	11.59%
USCA	$5.07M	$0.56M	12.18%
Africa	$2.29M	$0.25M	12.50%

Africa has the highest average profit ratio but the smallest sales base. This illustrates the distinction between margin efficiency and absolute contribution. Europe has the largest profit pool, while Africa is the strongest market on the reported average ratio.

Low Profit Exposure

The low-profit screen identifies 52.937 rows with an order-item profit ratio below 10%. Because the analysis is row-based, this is not the same as 52.937 unique orders. The result should be supplemented with unique order count, sales exposure, and total profit impact before operational targets are set.

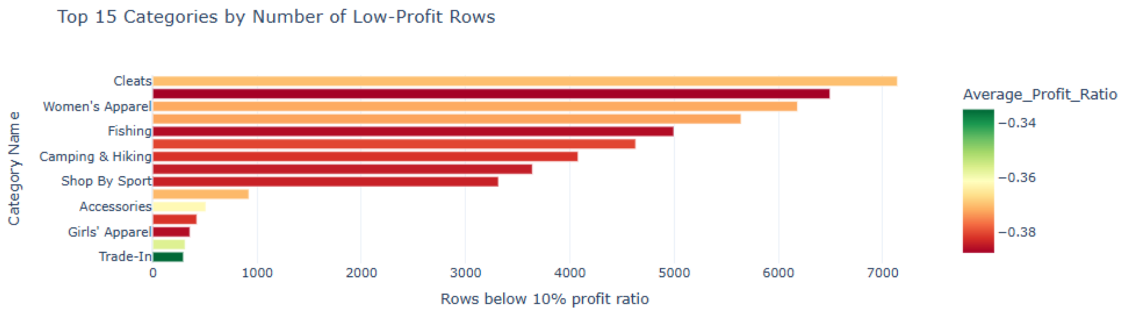

Figure 5 Categories with the largest number of rows before a 10% profit ratio

Cleats has the largest number of low-profit rows, followed by Women's Apparel, Fishing, and Camping and Hiking. The chart also indicates deeply negative average profit ratios within several leading categories. High frequency and negative average profitability make these categories stronger investigation candidates than categories with only a small number of exceptions.

Discount Performance

Total sales and profit are highest in the 5% to 10% and 15% to 20% bins largely because those bins contain more business volume. Due to the volume, totals alone do not show discount effectiveness, so the average profit ratio provides the more comparable view across bins.

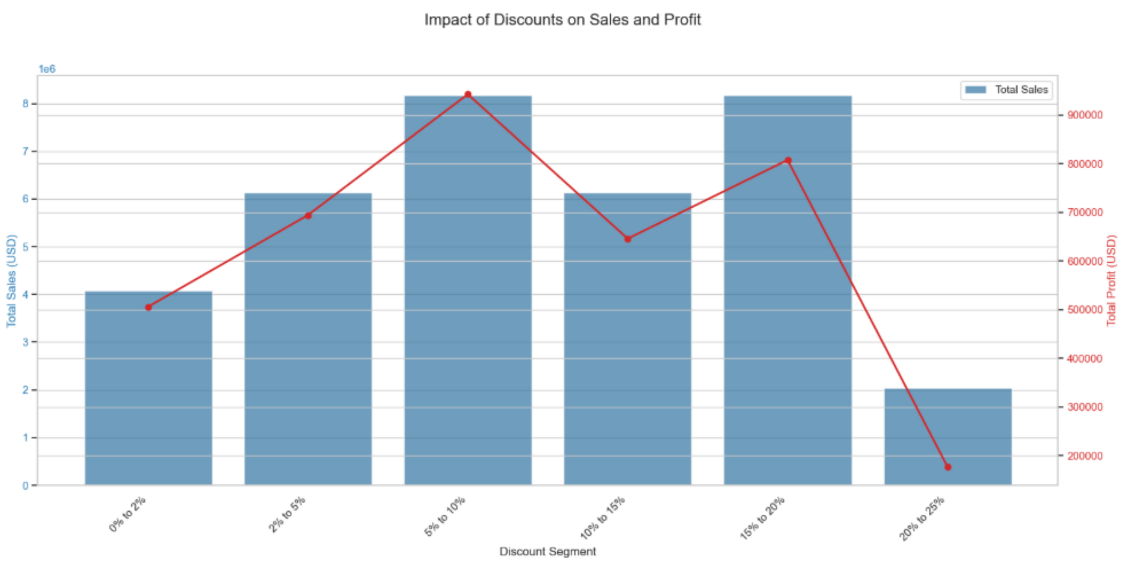

Figure 6 Sales and profit totals by discount segment

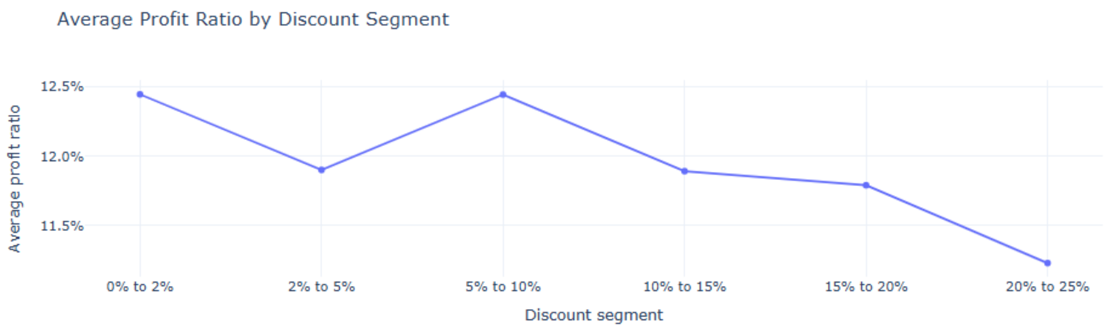

Figure 7 Average profit ratio by discount segment

Average profit ratio fluctuates near 11.8% to 12.5% through the bins below 20%, then falls to approximately 11.2% in the 20% to 20% bins. The evidence is consistent with lower profit ratio at the highest discount level.

Monthly Discount and Sales Pattern

The average monthly discount rate remains tightly clustered around 10.1% to 10.3%. Sales vary much more than the discount rate, and the final sales decline occurs while the average discount rate remains within its historical range. Based on the chart, broad monthly discount movement does not explain the late-period sales decline.

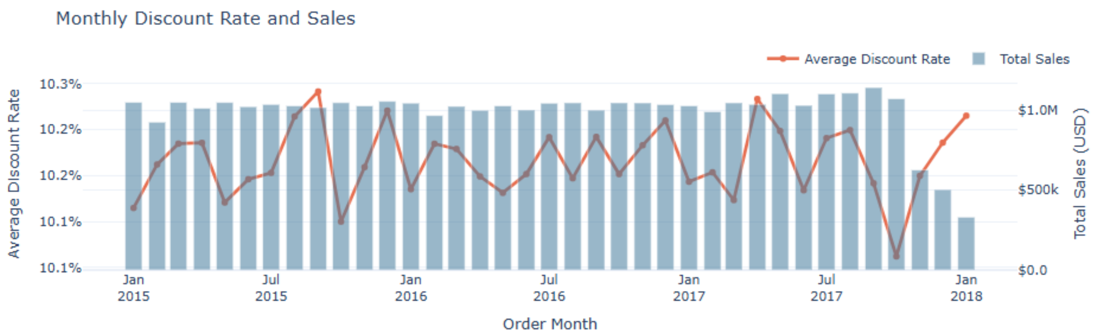

Figure 8 Average discount rate and total sales by month

Shipment and Delivery Analysis

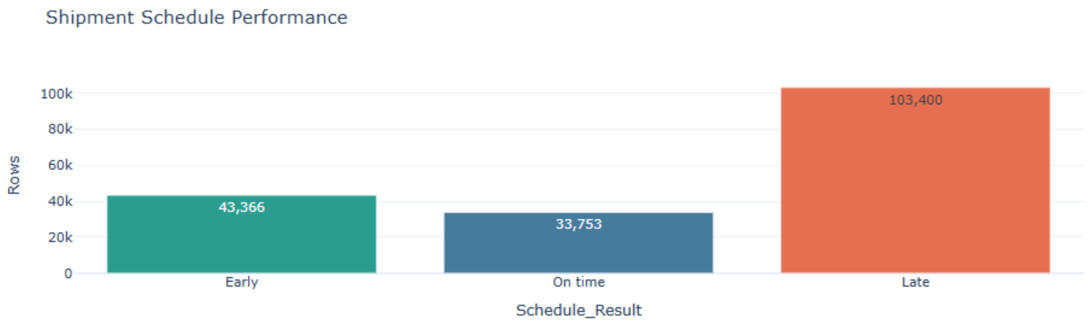

Figure 9 Shipment Schedule Performance

The shipment schedule performance indicates a significant delivery issue. Of 180,519 shipments, 103,400 (approximately 57%) were late, compared with delivery on time and early. Late shipments are approximately three times more frequent than on-time shipments, suggesting potential issues in planning or transformation. Further analysis is required to identify what causes the dely.

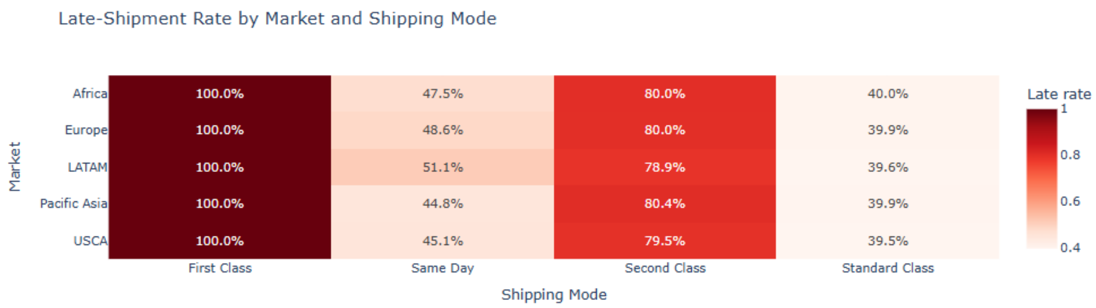

Figure 10 Late-Shipment by Market and Shipping mode

Shipping mode appears to be a stronger reason for late-shipment performance than market. First Class records a 100% late rate across all markets, while Second Class remains consistently high at approximately 79-80%. In contrast, Standard Class has the lowest rate at around 40%. The consistency of these patterns across markets suggests that delays may be related to shipping-mode processes or scheduling assumptions rather than regional performance. However, seeing exactly 100% for every single market is unusual. Further investigation is required.

Figure 11 Correlation chart

The standout relationship is between Order Profit Per Order and Order Item Profit Ratio, with correlation 0.82. The result is obvious, as orders with higher profit ratios tend to generate higher profit per order.

For shipping, the correlation between Actual shipping days and Scheduled shipping days is 0.52. The result indicates that longer scheduled delivery generally corresponds to longer actual delivery times.

The correlation chart shows that the commercial variables, such as sales, profit, and discount, have zero correlation with actual shipping days. Based on these correlations, delivery performance appears to be more closely associated with scheduling and shipping types than with the commercial variables.
